

Loose Denture?

Tired of gooping up your lower denture with adhesive to try and keep it in place so you can try to talk and eat normally? Do you miss the stability of having solid lower teeth to chew with? Have you looked at dental restorations offered that replace your missing teeth with implant supported crown and bridgework, only to find out that to have it done, you would have to take out a second mortgage on your home?

Consider a mini dental implant supported lower denture. For a very reasonable investment on your part, four surgical grade titanium mini implants are painlessly placed in the lower jaw and your lower denture is retrofitted with four o-ring snaps which engage and support your lower denture when seated. Your chewing efficiency goes way up to near normal since the denture is now supported by the jaw bone rather than loose gum tissue. Feel like biting an apple? Go ahead and do it!

The procedure takes a bit over an hour in the dental chair and you can use your new stable teeth as soon as you leave the office. The process is painless and requires only a little local anesthetic. Curious about how easy this would be for you to have done? The process can also be used to stabilize a loose upper denture as well. Give us a call and we'll be happy to explain, or better yet, schedule a (free) consultation with Dr. Rundle and we'll be happy to demonstrate the system to you! Call today! 219-836-7684
